5	Implementation Details	3

Abstract—This manual explains steps to implement JK flip flop synchronous counters with D flip flops using finite state machine.

1 Components

Component	Value	Quantity
Bread Board		1
Resistor	≥ 220Ω	1
Vaman board		1
7 Segment Display	Common Anode	1
Decoder	7447	1
Flip flop	7474	1
Jumper Wires		20

TABLE 0: Components List

Vaman board with arm GCC tool chain using D-flip flops. The *state transitioning* decoder and *display* decoder are part of *combinational* logic, while the *delay* is part of *sequential* logic.

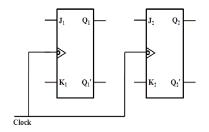

Fig. 1: Synchronous counter with JK flip flops

2. The required J and K inputs for 2 J-K flip flops are as mentioned in the Table 2.

Pres	ent state	Next	state	Flip flop Inputs				
X (Q ₁)	W (Q_2)	B (Q ₁ +)	$A (Q_2^+)$	\mathbf{J}_1	K ₁	J_2	K ₂	
0	0	1	0	1	X	0	X	
1	0	0	1	X	1	1	X	
0	1	1	1	1	X	X	0	
1	1	0	0	X	1	X	1	

TABLE 2: JK flip flop State Transition Table

2 THE ASSIGNMENT

1. **Problem Statement:** A synchronus counter using two J-K flip flops that goes through the sequence of states: $Q_1Q_2 = 00 \rightarrow 10 \rightarrow 01 \rightarrow 11 \rightarrow 00$.. is required as mentioned in Fig. 1. We need to implement this sequencing logic on

3. From the columns of J_1,K_1, J_2,K_2 , we can say

$$J_1 = 1 \tag{2.1}$$

$$K_1 = 1 \tag{2.2}$$

$$J_2 = Q_1 \tag{2.3}$$

$$K_2 = Q_1 \tag{2.4}$$

3 REALIZATION OF JK FLIP FLOP USING D FLIP FLOP

1. Now, we have to design to realize JK flip flop using a D flip flop. D flip flop is primarily meant to provide delay as the output of this flip flop is same as the input.

The first thing that needs to be done for this conversion is to draw the truth table for both the flip flops as shown in Table 1. The next step is to create the equivalent K-Maps for the required outputs.

J	K	Q	Q^+	D
0	0	0	0	0
0	0	1	1	1
0	1	0	0	0
0	1	1	0	0
1	0	0	1	1
1	0	1	1	1
1	1	0	1	1
1	1	1	0	0

TABLE 1: JK vs D Transition Table

2. The K-Map for required input- output relation is as shown in Fig 2

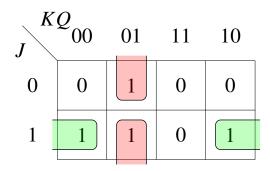

Fig. 2: K-map for D.

3. Obtain the state transition equations for **D** from Fig. 2

$$D = JQ' + K'Q \tag{3.1}$$

4 FINITE STATE MACHINE

1. Fig. 1 shows a *finite state machine* (FSM) diagram for the counter in Fig. 1.

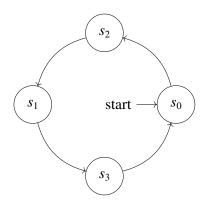

Fig. 1: FSM for the counter

2. From 3.1, D inputs for D flip flops are derived using the following equations

$$Q_1^+ = D_1 = J_1 Q_1' + K_1' Q_1$$
 (4.1)

Substituting values for J_1 , K_1 from 2.1 and 2.2,

$$Q_1^+ = D_1 = 1Q_1' + 0Q_1$$
 (4.2)

$${O_1}^+ = D_1 = {O_1}' \tag{4.3}$$

Similarly,

$$Q_2^+ = D_2 = J_2 Q_2' + K_2' Q_2 \tag{4.4}$$

Substituting values for J₂, K₂ from 2.3 and 2.4,

$$Q_2^+ = D_2 = Q_1 Q_2' + Q_1' Q_2$$
 (4.5)

$$Q_2^+ = D_2 = Q_1 Q_2' + Q_1' Q_2$$
 (4.6)

3. The *state transition table* for the FSM is Table 3 where the present state is denoted by the variables $W(Q_2), X(Q_1)$ and the next state by $A(Q_2^+), B(Q_1^+)$.

X	W	В	A
0	0	1	0
1	0	0	1
0	1	1	1
1	1	0	0

TABLE 3: State Transition Table for D flip flops

The associated equations are:

$$A = XW' + WX' \tag{4.7}$$

$$B = X' \tag{4.8}$$

5 Implementation Details

- 1. Connect the Vaman board, 7447, 7474 as per the details mentioned in Table 2 and Fig 2
- 2. The code for arm GCC implementation is avaiable at the following github link

https://github.com/satheeshsimha/fwc-2/blob/main/ide/assignment/codes/assignment1D_ide.cpp
